## About this table

This table shows the compositions, typical mechanical properties, and relevant BS EN standards and uses for copper-aluminium (aluminium bronze), copper-nickel and copper-nickel-zinc (nickel silver) wrought copper alloys. Information on general characteristics and uses, and machinability, is also provided. Information is ordered by description and EN number.

Note that not all elements listed as impurities are shown here. For the full chemical composition you should refer to the standard or the Copper and copper alloys. Compendium of compositions and products PD CEN/TS 13388.

For more detail, the appropriate standard(s) should be consulted. Visit our page with details of standards and links to the BSI shop.

## <u>Table notes</u>

Compositions are given as either a range or a maximum. The material conditions defined by the standards are given and—where mandatory—this is indicated

1652, 12163 and 12449 are for general purposes. 1653 is for boilers, pressure vessels and hot water storage units. 1N/mm<sup>2</sup> = 1MPa

B – mandatory spring bending limit

G – mandatory grain size H – mandatory hardness

M – as manufactured

R – mandatory tensile strength

X – no mandatory tensile properties
